

Full stack Task

Task Description

Act as if you're joining a music distribution company as a fullstack Developer The company manages artists and their tracks, distributing music to DSPs (Digital Service Providers) like Spotify, Apple Music, and YouTube. Your main task is to build a **Track Management API** with a simple Angular or React front-end.

What You'll Build

TASK 1— Backend (.NET Web API)

Data Model — design and create the following entities:

- **Artist** — id, name, email, country
- **Track** — id, title, artist_id, isrc (unique identifier per track), release_date, genre, status (draft / submitted / distributed)
- **DSP** — id, name (e.g. Spotify, Apple Music, YouTube)
- **TrackDistribution** — id, track_id, dsp_id, submitted_at, status (pending / live / rejected)

Required endpoints:

Method	Route	Description
POST	/api/artists	Create an artist
GET	/api/artists	List all artists
POST	/api/tracks	Create a track for an artist

GET	/api/tracks	List tracks with filters: ?artistId=&genre=&status=
GET	/api/tracks/{id}	Get track details including its DSP distribution statuses
POST	/api/tracks/{id}/di stribute	Submit a track to one or more DSPs
PATCH	/api/tracks/{id}/st atus	Update a track's status

Requirements:

- Use **EF Core** with proper migrations
- Follow **Clean Architecture**
- Input validation with meaningful error responses
- At least one endpoint must be **JWT-protected**
- Seed the database with realistic sample data: 3+ artists, 8+ tracks across different genres and statuses, 3 DSPs

TASK 2 — Front-End (Angular OR React)

Build a simple single-page UI with two views:

1. **Track List** — displays all tracks with their artist's name, genre, and current status. Allow filtering by status.
2. **Track Detail** — click a track to see its full info and which DSPs it has been distributed to and their statuses.

No design system required. Functional is enough.

TASK 3— The Vibe Coding Challenge, Read Carefully

This is where we actually evaluate you — not just the code.

You are expected and encouraged to use AI tools (Cursor, Copilot, ChatGPT, Claude — whatever you use daily). However, you must submit a **DECISIONS.md** file answering these questions:

1. **What did AI generate for you, and what did you write or modify yourself?** Be honest.
 2. **What security issues did you find (or introduce) in the AI-generated code?** How did you handle them?
 3. **One thing the AI got wrong is** that you had to fix. What was it and why was it wrong?
-

Submission Requirements

- GitHub repo (public or shared access) with a clean commit history — **do not squash everything into one commit**
 - **README.md** with setup instructions, how to run migrations, and how to obtain a JWT token
 - **DECISIONS.md** as described above.
 - Submission Date is a maximum of 5 days from the date of receiving the Document.(Weekend is included).
 - Please add your Response in a Google Drive Doc accessible link. Name it in this way FIRSTNAME_SECONEDNAME_FULLSTACKDEVELOPER.inside the Document, Add as the links as follows; 01_ Project link ([github link](#)) 02_How to run the project ([readme link](#))03_Vibe coding challenges ([decicsion.md link](#)).
-

We wish you Best of Luck!
